SUMMARY

Backend-focused software engineer shipping production fintech systems in NestJS, TypeScript, and PostgreSQL. Builds idempotent payment and webhook pipelines, secure REST APIs, and Dockerized microservices on Google Cloud Run. Also sole frontend engineer on a 34K-LOC React Native payments app taken from architecture to beta release.

TECHNICAL SKILLS

Backend: Node.js, NestJS, REST APIs, WebSockets, JWT & Auth0, API Security, Idempotency, Webhooks

Databases & Caching: PostgreSQL, Prisma ORM, Redis, Schema Design, Query Optimization

Languages: TypeScript, JavaScript (ES6+), SQL

Frontend: React, Next.js, React Native (Expo), Redux Toolkit, RTK Query, i18n

Cloud & DevOps: Google Cloud Run, Docker (multi-stage), Azure DevOps CI/CD, Pub/Sub, Firebase, Sentry, Git

Core Concepts: Data Structures & Algorithms, OOP, System Design, Scalability, Asynchronous Architecture

EXPERIENCE

Fullstack Developer, Lumifin — Noida, India (Dec 2025 - Present)

Backend

- Build and ship REST APIs across user, KYC, and notification microservices in NestJS and TypeScript, deployed on Google Cloud Run with PostgreSQL via Prisma ORM and integrations with Auth0, Sumsb, and Twilio
- Eliminated duplicate event processing under redelivery storms by implementing idempotent webhook ingestion with HMAC-SHA256 signature verification and a Prisma-backed processed-event table deduping Google Pub/Sub retries
- Prevented invalid state transitions at the database layer by designing PostgreSQL schemas with forward-only state-machine constraints for KYC and payment-intent tables
- Cut deploy time and risk with multi-stage Docker builds and Azure DevOps CI/CD pipelines using change-detection logic for selective Cloud Run deploys across dev and QA

Frontend

- Sole frontend engineer on a cross-border fintech payments app in React Native (Expo) and TypeScript — 34K LOC, 48 screens, 100+ components — owning architecture through QA to beta release with a Redux Toolkit and RTK Query data layer (13 API slices) and full EN/FR i18n
- Eliminated double-charge risk on retries and network races by engineering idempotent QR payout and fiat on-ramp flows with per-intent X-Idempotency-Key headers, a three-layer duplicate-submission guard, and status-based 409 reconciliation
- Integrated Auth0 (JWT, biometric/MPIN, silent token refresh), Sumsb KYC, and TransFi on-ramp, and instrumented Firebase Analytics/Crashlytics/Performance and Sentry across a four-environment Expo build pipeline with pre-commit quality gates

PROJECTS

Prepwise — AI Voice Mock-Interview Platform | *Next.js 15, TypeScript, Gemini 2.5 Flash, Web Speech API, Firebase, Zod* | [GitHub](#)

- Built an AI voice mock-interview app in Next.js 15 (App Router, server actions) that generates role-specific question sets and scores full transcripts across five competency dimensions with strengths and improvement areas
- Replaced a paid per-minute voice agent with a browser-native voice layer (Web Speech API TTS + STT) featuring continuous recognition that tolerates mid-answer pauses, enabling free unlimited daily practice
- Architected the platform to run entirely on free-tier services using Firebase Auth and Firestore with Zod-validated AI output for reliable persistence

EDUCATION

Chitkara University, Punjab, India — B.E. in Computer Science Engineering (May 2022 - 2026)
